

Try these

1. Find any five **SET**s among these set of cards (repetition of cards allowed).

2. This is an example for a magic square in **SET**s. Can you make another two?

7.4 Map Colouring

Map colouring is the act of assigning different colours to different features on a map. In Mathematics, the problem is to determine the minimum number of colours required to colour a map,so that no two adjacent regions have the same colour. Let us learn about the role of map colouring.

Situation:

The teacher divides the class into two groups and instructs one group to use as many colours possible and another group use minimum number of colours for the given patterns.

The only rule is that, shaded regions cannot share the same colour at edges, although they are allowed to meet at a corner.
